Adolescents and Adults with Autism: Applied Behavior Analysis & Evidence-based Practice in Support of Competence and Quality of Life

Peter F. Gerhardt, Ed.D.
The McCarton School
Pgerhardt@Mccartonschool.org
Unfortunately, the application of ABA with adolescents and adults with ASD is often understood in very simple terms:

Antecedent (yelling) → Behavior (crying) → Consequence (R+ comfort OR R- yelling stops)
When in reality it is much more complex

EOs/Setting Events
• Learning history
• Adolescence & its impact
• Communication challenges
• Social challenges
• Mental health challenges
• Physical health
• Medication side effects
• Environmental stressors
• Curriculum considerations
• Boredom
• Sexuality
• Sleep issues
• Aging in & of itself
• Yada, yada, yada...

“Let’s go to work”

Behavior

Behavior Analyst

“Huh?”
Understanding ABA as applied to competent adulthood

ABA is a field of inquiry dedicated to investigating and modifying behavior in a systematic way. ABA is:

- Data-based
- Analytical
- Able to be replicated
- Socially important
- Contextual
- Accountable  (Sulzer-Azaroff & Mayer, 1991)
Why are interventions based upon the principles of AB A effective with older individuals?

- Applied Behavior Analysis is a vast scientific discipline based upon over 35 years of published research.
- Interventions based up Applied Behavior Analysis recognize the power of positive reinforcement.
- By the way, you should know that in supporting adolescents and adults there are times where previously accepted “prompt hierarchies” may have to be modified as a function of community standards and normative behavior.
Why are interventions based upon the principles of AB A effective with older individuals?

- Behavior Analysts respect the role of significant others in the individual’s life as *central* to the implementation of an effective intervention.
- Behavior Analysis represents a teaching methodology with tremendous versatility beyond discrete trial instruction.
  - Fluency/Rate-base instruction → Instructional Intensity
  - Shaping & Chaining
  - Task Analysis
  - Functional behavior analysis/assessment
  - PRT or NET
  - Incidental strategies
  - OBM, Precision Teaching, Verbal Behavior, Relational Frame Theory
  - Peer Modeling – Environmental/Curricular Modifications
Why are interventions based upon the principles of AB A effective with older individuals?

- Instruction based upon Applied Behavior Analysis **DOES NOT** represent a rigid, unyielding, and unalterable set of instructions and/or interactions. In fact, good behavior analysts modify their instructional interventions in response to a slew of conditions, settings and contingencies while maintaining a commitment to data-based decision-making.
And lastly

“...happiness among people with profound multiple disabilities can be defined, reliably observed, and systematically increased” supporting the fact that “the contributions of behavior analysis for enhancing the quality of life among people with profound and multiple disabilities may be increased significantly.”

C. Green & D. Reid, 1996
Happiness? What does behavior analysis have to do with happiness?

Some basic challenges to evidence-based practice with older learners
The prevalence of pseudoscientific or simply unproven interventions leading up to adulthood
WHY DOES THE SUN SET?

IT'S BECAUSE HOT AIR RISES. THE SUN'S HOT IN THE MIDDLE OF THE DAY, SO IT RISES HIGH IN THE SKY.
“If more and more people can be convinced that a system of belief is correct, then clearly it must, after all, be correct” (Festinger, Riecken, & Schachter, 1954)
So real science, in the form of peer-reviewed research, is critically important because:

- Seeing is not believing
- Correlation does not mean causation
- With a population of 310,000,000 people, one in a million occurrences happen to 310 Americans each day just as a matter of chance and coincidence.
- As professionals, we have an ethical obligation to our clients to provide treatment and intervention that is evidence-based and, thereby, most likely to be effective.
I just want to point out

- that, particularly in autism and behavior analysis, we need to exercise caution whenever anybody says you need to “think outside of the ABA-box”. Why? Because unless they really, really know the ABA-box they are just making shit up.
“All our science, measured against reality, is primitive and childlike- and yet it is the most precious thing we have.”
“A major difficulty confronting those interested in adolescents and adults with autism is a lack of empirical data.”

(Mesibov, 1983, p. 37)
A search of the PsychINFO data-base using “autism” in the title & bounded by the year of publication resulted in:

The parameters defining successful outcomes for adults are, well, vague at best.
“I continue to be amazed that you function as an independent adult.”

- Jim Sack
Providing evidence-based intervention to adults is a more complex process than you might think...

“These children often show a surprising sensitivity to the personality of the teacher [ ]. They can be taught but only by those who give them true understanding and affection, people who show kindness towards them and yes, humor [ ]. The teacher’s underlying attitude influences, involuntarily and unconsciously, the mood and behavior of the child.”

-Hans Asperger, 1944

In other words, you need to become a conditioned reinforcer if you are to be an effective behavior change agent.

Relationship quality (rapport) between people with developmental disabilities and their caregivers has long been suggested as an important variable influencing the likelihood of problem behavior. However, to date, the association between rapport and problem behavior has not been systematically investigated. The authors evaluated a multi-method strategy for assessing rapport and then used the assessment information to develop a multi-component intervention for problem behavior. *In Study 1, a descriptive assessment was carried out in which rapport was operationally defined, and good and poor rapport dyads consisting of staff members and participants were identified. Then, a functional analysis of each participant’s problem behavior was conducted with respect to the interaction of two factors: quality of rapport and task demands. The results of the assessment study indicated that when rapport was poor, levels of problem behavior were high; when rapport was good, levels of problem behavior were low. In Study 2, the authors evaluated the effectiveness of a multi-component intervention package designed to improve rapport between the person with disabilities and his or her caregiver. When rapport improved, participants showed a decrease in problem behavior and an increase in task completion in the presence of staff members who had previously been identified as having poor rapport with participants. The multidimensional nature of rapport assessment, as well as the unique contribution that rapport-building can make to multi-component intervention, are discussed.* (PsycINFO Database Record (c) 2010 APA, all rights reserved)
five
There continues to be limited interest in adults and a persistent belief that they have “maxed out” in terms of skill development.

Which is further “complicated” by the fact that no one stays in the field.

Given all that, it should come as no surprise that what we do know about adult outcomes should not make us all that happy...
Adult outcome research

- Adult outcomes can, at least in part, be seen as a function of adaptive behavior competencies (Mazefsky, Williams, & Minshew, 2008). It is not an overstatement to say that adaptive behavior competencies will get you through times of no academic skills better that academic skills will get you through times of no adaptive behavior competencies.
Adaptive Behavior

Adaptive Behavior is defined as those skills or abilities that enable the individual to meet standards of personal independence and responsibility would be expected of his or her age and social group. Adaptive behavior also refers to the typical performance of individuals without disabilities in meeting environmental expectations. Adaptive behavior changes according to a person’s age, cultural expectations, and environmental demands. (Heward, 2005).”
Adaptive behavior and ASD

- Adaptive behavior is not considered one of the core symptoms of ASD and, as such, receives significantly less attention in terms of effective intervention and current research.

- Despite the exclusionary criterion of “no clinically significant delay in [ ] the development of age appropriate self-help skills [and] adaptive behavior (other than social interaction)” in diagnosing Asperger Syndrome, research indicates that for this group of learners the gap between IQ and adaptive behavior can be marked. (Lee & Park, 2007; Myles, et al, 2007)
Holy adaptive behavior Batman! Your underwear is outside your pants.
Adaptive behavior is important because the world does not always play by the rules.
Adaptive behavior and adult outcomes

In a group of 20 adolescents with Asperger syndrome, Green, et al (2000) found that despite a mean IQ of 92 only half were independent in most basic self-care skills including brushing teeth, showering, etc. None were considered by their parents as capable of engaging in leisure activities outside of the home, traveling independently, or making competent decisions about self-care.
Howlin, et al (2004) surveyed 68 adults with autism with an IQ of above 50 and found a majority (58%) were rated as having poor or very poor outcomes. With regards to employment status they found

- 8 were competitively employed
- 1 was self employed earning less than a living wage
- 14 worked in supported, sheltered or volunteer employment
- 42 had “programs” or chores through their residential provider.
Two under-researched areas of adaptive functioning in adults
Sexuality

In two (somewhat) recent studies, (McCabe & Cummins, 1996; Szollo & McCabe, 1995) researchers concluded that individuals who have an intellectual disability have lower levels of sexual knowledge and experience in all areas except menstruation and body part identification when compared to a typical student population.
Stokes, Newton, & Kaur (2007) examined the nature of social and romantic functioning in adolescents and adults with ASD. What they found was that individuals with ASD were more likely than their NT peers to engage in inappropriate courting behaviors; to focus their attention on celebrities, strangers, colleagues, and exes; and to pursue their target for longer lengths of time (i.e. they engaged in stalking).
Why ABA?

- Despite much discussion about decision making skills in the self-determination literature (e.g., Clark, et al., 2004), there continues to be “lack of evidence [supporting the] effectiveness of sex education and training for persons with developmental disabilities” (Duval, 2002, p. 453) which Behavior Analysis is able to provide.
Adaptive Behavior and Incarceration

- Professionals have been aware of high rates or learning and behavior disorders among incarcerated youth for some time (Moffitt, 1990) leading some professionals to characterize the juvenile justice system as a default system for special needs learners with more complex emotional and behavioral challenges (Quinn, et al, 2005)
Adaptive Behavior and Incarceration

Paterson, (2008) looked at two adults with Asperger Syndrome incarcerated in the U.K. Both individuals faced challenges understanding the complex formal and informal social hierarchies of prison life and accepting unfamiliar or non-preferred rituals and routines. Both were ultimately placed in a modified form of secure custody for their own safety.
Apparently we need to do things different, do them better, and have more research on which to base our interventions.
First, we tend to focus on the “production” component of adaptive behavior to the detriment of the social and navigation components (i.e., context).
You Are In An Elevator …

- What are the rules are for standing in the elevator? Where do people stand when there are only two or three people? What happens when a fourth person enters the elevator?
You Are In An Elevator …

- What are the rules are for standing in the elevator? Where do people stand when there are only two or three people? What happens when a fourth person enters the elevator?

- If there are only two or three people on an elevator, each person usually leans against the walls. If a fourth person boards the elevator, the four corners are normally occupied.
You Are In An Elevator …

- What happens when the elevator becomes more crowded and there are now four or more people?
You Are In An Elevator ...

- What happens when the elevator becomes more crowded and there are now four or more people?
- When there are more than four people on an elevator, the occupants begin to follow a complex set of rules for behavior. Everyone turns to face the door. Hands, purses, and briefcases hang down in front of the body. People usually scrunch up, rounding their shoulders, so that they take up as little space as possible.
You Are In An Elevator …

- How close will people stand? What is allowed to "touch?"
You Are In An Elevator ...

- How close will people stand? What is allowed to "touch?"

- People don’t touch each other in any way unless the elevator becomes very crowded, and then they only touch at the shoulders or upper arms. If you see an overcrowded elevator, you will probably choose to wait for the next one.
You Are In An Elevator ...

- What do people look at in a crowded elevator?
You Are In An Elevator ...

- What do people look at in a crowded elevator?
- Everyone usually looks at the floor indicator located above the door.
You Are In An Elevator …

- When is it permissible to talk to the other people?
When is it permissible to talk to the other people?

It is unusual for strangers to speak to each other in an elevator unless they are sharing some kind of similar experience (such as a conference). People who do know each other will usually speak softly. When a group of people enter the elevator and do not follow these rules, other occupants usually feel very uncomfortable.
You Are In An Elevator ...

- If you think this behavior is exaggerated, the next time you are on an elevator, don’t face the door. Turn around and face toward the other occupants. See what their reaction is. If you really want to upset everyone, give them a big grin.
With the resulting task analysis looking something like this...

<table>
<thead>

</table>
Second, our repertoire of evidence-based interventions are often used to teach inconsequential skills because they are either easy, safe, or both.
Anecdotally, there are few skill excesses or deficits that the community-at-large cannot be taught to, if not accept, then tolerate. These include:

- Extreme aggression/self injury
- Inappropriate eating/mealtime behavior
- Inappropriate toileting/restroom use
- Inappropriate sexual behavior
- Poor hygiene
Yet we continue to focus on a subset of skills that we assume to be functional including (but not limited to):

- Sorting, collating, packaging, assembly
- Shoe tying
- Money concepts v. Purchasing skills
- School-based activities v. Community-based activities
- Nonfunctional academics (few of us really need to differentiate between a horse and a zebra on a regular basis)
So it seems…

Despite how evidence-based your interventions are, teaching inconsequential skills well is really no better than teaching essential skills poorly.
Third, as learners grow beyond the age of 10-years or so, the concept of “intensity of instruction” is slowly abandoned in favor of a more typical pace of instruction. For example:
At the age of 5-years, learner “A” required 1,000 trials (50 sets of 20 trials) of color identification instruction to be able to consistently identify all 64 colors in the Crayola box across all teachers and all environments.
At age 15-years however...

- and with the goal of buying lunch at Burger King, he will probably be presented with (at most) 1 trial/week. At this pace of instructional intensity he will require over 20 years of instruction to equal the number of learning opportunities necessary to acquire a simple discrimination skill (i.e. color ID).
Fourth, in community-based instruction of adaptive skills, there may be a tendency for professionals to focus on the wrong contingencies. That is, there may be greater professional reinforcement available for the absence of “problems” in the community than for any actual skill development by their students.
Fifth, we may need to think and read outside the literature base with which we are most comfortable and most familiar. For example:
Hagner & Cooney (2005) interviewed the supervisors of 14 successfully employed individuals with autism to examine their supervisory practices and their perceptions of employees with autism. Supervisors evaluated their employees with autism highly, and qualitative analysis found that a set of specific supervisory accommodation strategies were commonly associated with successful supervision. These included:

- maintaining a consistent schedule & set of job responsibilities; (activity schedules/task analysis)
- using organizers to structure the job (visual supports)
- reducing idle or unstructured time (Differential R+ of Alternative behavior - DRA)
- being direct when communicating with the employee, and (present a clear and accurate Sd or instructional directive)
- providing reminders and reassurances (prompting and reinforcement)
In the literature on emotional intelligence, social competence is generally described as existing along a continuum from social survival to true social competence and is, to a very large degree, understood as being context bound (Topper, Bremner & Holmes, 2000). This would tend to indicate that teaching social skills (or social adaptive behavior) out of context might be a necessary, but not a sufficient criterion, for future social competence. In addition, their concept of social survival implicates response effort as one of the many parameters impacting social competence.
# ABA beyond JABA: Social competence & response effort

## Competence Response Effort

<table>
<thead>
<tr>
<th>Skill</th>
<th>Necessary: Skills upon which independence may depend (low response effort or social survival)</th>
<th>Preferred: Skills that support independence but may not be critical</th>
<th>Marginal: Skills that, while valuable, may be negotiable (high response effort or social competence)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Lunch with co-workers</strong></td>
<td>Eat Neatly</td>
<td>Respond to interaction from co-workers</td>
<td>Initiate interactions with co-workers</td>
</tr>
<tr>
<td><strong>Hallway Greeting</strong></td>
<td>Respond to the greeting with acknowledgement (head nod)</td>
<td>Orient briefly toward the person and offer acknowledgement</td>
<td>Orient, acknowledge and answer greeting including use of person’s name</td>
</tr>
</tbody>
</table>
Adkins, et al, (2002) demonstrated that the behavior plans developed and written by certified behavior analysts were written at a reading level well above those staff whose job it was to implement the plans. Further, the authors found that modifying the readability level of these plans resulted in enhanced treatment outcomes for all individuals in the study. And the moral to this story is when it comes to training, you are only as competent as your audience will allow you to be.
Sixth, we need to figure out creative ways to use our technology to get around the boulder...
The Use of Bluetooth® Technology to Promote Independent Responding in the Community: The Reduction of the Stigma of Prompting

PAAL
Preparing Adolescents for Adult Life

Purpose

- To examine the extent to which the Bluetooth technology can be used in lieu of gestural prompting during community based instruction.
The use of Bluetooth technology allowed prompting to be delivered from increasingly greater distances.
Reduced levels of physical and gestural prompting lead to greater independent functioning and reduction of stigma thereby promoting greater levels of social acceptance within the community.
A secondary benefit

- The participant frequently exhibited non-contextual vocalization across settings. The implementation of the Bluetooth disguised his vocalization as functional communication thereby reducing the stigma associated with this particular behavior.
And in terms of social validity

- Socially valid behavior interventions are those that
  - Are directed to problems of verifiable importance;
  - Are valued by designated target groups; and
  - Have sufficient impact to change the target behavior.

"I thought something wasn't quite right with him, but I didn't think it was as bad as that autism thing." - Rite Aid Cashier
So it seems we may need to retire some inaccurate terms...

Generally, the terms “high” or “low” functioning refer only to cognitive functioning or academic competencies and do not reflect the actual functional capabilities of an individual. “High functioning” individuals may actually function very poorly in terms of adult competencies while some “low functioning” individuals may be quite independent as a function of effective, targeted intervention.
What does ABA have to offer Quality of Life Considerations?
In case you forgot

“...happiness among people with profound multiple disabilities can be defined, reliably observed, and systematically increased” supporting the fact that “the contributions of behavior analysis for enhancing the quality of life among people with profound and multiple disabilities may be increased significantly.”

C. Green & D. Reid, 1996
A very quick example re: Happiness
Technology-: Electronics

MP4 player/ IPod™

Purpose:

To reduce stigma associated with one-on-one instruction (close proximity and physical prompts) by providing auditory /visual cues via watch during the workout routines at the local fitness center.
Baseline:

- Participants wore the MP4 player watch or IPod and earphones/headphones connected to the device.
- Use written schedule and a portable timer to follow the workout schedule (checking schedule, setting a timer).
- Partial and/full physical prompts were provided as needed.
Technology: Electronics

MP4 player/ IPod™

- Intervention:
  - Participants wore the MP4 player watch or IPod with earphones or headphones connected to the device
  - Verbal directions combined with highly preferred music were given via MP4 player or IPod
  - Partial/full physical prompts were provided as needed
Technology: Electronics

MP4 Player/IPod™ - Result

QOL as a human right?

All persons enjoy the “right to be left alone, [ ] the privilege of an individual to plan his own affairs,... to shape his own life as he thinks best, do what he pleases, go where he pleases [ ] the freedom to walk, stroll or loaf.”

Supreme Court Justice William O. Douglas (1973)
Can we really define “Quality of Life?”
Quality of life is a term used to describe a temporal condition of personal satisfaction with such core life conditions as physical well-being, emotional well-being, interpersonal relations, social inclusion, personal growth, material well being, self-determination, and individual rights.

- R. Schalock, (2001)
Choice, control and competence in quality of Life
What variables are most likely to enhance the QOL of different individuals at different times in their lives?

with
Behavior Analysis
Recommendations for Future Research and Practice

- Assessment methods to identify functionally relevant skills (i.e., true adaptive behavior) for development in the community.
- Effective behavior analytic instruction in community-referenced safety skills. Issues related to long term maintenance.
- Retrospective studies of “successful v. unsuccessful” adults on the spectrum to help identify effective strategies and interventions.
- Effective methods of community training to promote great levels of social inclusion for learners with ASD across multiple environments.
Recommendations for Future Research and Practice

- Effective models of transition intervention resulting in more positive outcomes.
- Cost-benefit analyses of current models v. less “facility-based” models of adult services and support.
- Issues related to staff recruitment and retention.
- Family support issues and intervention for parents of adults.
Recommendations for Future Research

- Implications of fluency-based interventions on the development of adaptive responding with older learners
- Competency-based models of staff training in the provision of community-based instruction
- Implications of instruction in social survival skills v. more typical social competence skills.
- Effective instruction in the areas of sexuality and sexual safety
- Models of therapeutic intervention in the criminal justice system
